

Item container service

The item container is a service that is used to structure elements (other services) in a container. The container can contain navigation (interaction design) parts depending on the implemented templates. Because of the open nature of this service/function many containers and interaction designs can be created. For example item viewers (image viewers, movie viewers, etc.) and menus (vertical and horizontal tabs, etc.)

Title

The title or name of the container service.

Description

The description of the container service.

Design template

For selecting the design / interaction design definition.

Cast child meta data

This option enables to extend the page meta data with the selected container item meta data in several ways.

- * Disabled
The meta data casting is disabled.
- * Replace page meta data
The page meta data is replaced by the selected item in the container.
- * Extend page title, extend rest
Adds the selected container item title to the page title and replaced the description and meta keywords.
- * Extend all page metadata

Adds the selected container item's meta title, description and keywords to the page meta data.
