

## Xsdot AJAX platform

Xsdot AJAX enables sophisticated interaction designs and improves the web site's usability while still maintaining backwards compatibility.

Ajax (Asynchronous JavaScript) is a group of interrelated web development techniques used on the client side to create interactive web applications and services. By using Ajax, web services can retrieve data from the web server asynchronously in the background.

The use of Ajax has led to an increase in interactive or dynamic interfaces on web pages and services.

Xsdot developed standard Ajax libraries that enable developers to quickly implement Ajax functionalities into its services and applications.

All Xsdot Ajax services are backwards compatible ensuring correct usability and readability for both human readers and robot reader (For example search engines).
