

Page service

The page service represents an empty framework that is used for creating web pages. By default a web page service is indexed by the internal search engine and web pages are published to external search engines when using a 'Search engine publisher' service.

The screenshot shows a web form titled 'Page service'. It contains four input fields:

- title:** A text box containing 'Page service'.
- additional link title:** An empty text box.
- description:** A larger text area containing 'Page description.'
- meta keywords:** A text box containing 'Keyword a, Keyword b, Keyword c, Keyword d, Keyw' followed by a small edit icon.

Title

The title or name of the page. The title is presented to search engines and can be presented in the page (Item presentation properties)

Additional link name

This is the title that is used when the page is presented as a link. When no additional link name is given then the page title is used automatically.

Description

The description is presented to search engines and can be presented in the page (Item presentation properties)

Meta Keywords

The meta keywords have two functions,

- * Meta keywords are presented in the page meta data for search engines.
- * Meta keywords are searchable by the application search engine. For example, if you want your content to be searchable by specific keywords that are not used in your content you can add these keywords in this field.
