

Content service

The content service is used for creating text elements in for example web pages or content. It contains a wysiwyg ('what you see is what you get') editor and implements many functions to create rich text content.

Title

The title or name of the page. The title is presented to search engines and can be presented in the page (Item presentation properties)

Additional link name

This is the title that is used when the page is presented as a link. When no additional link name is given then the page title is used automatically.

Description

The description is presented to search engines and can be presented in the page (Item presentation properties)

Text styles

Use the font style icons to apply styles to texts (select text and click on the style icons)

- | | |
|-----------|-------------------------------|
| Bold | For applying bold style. |
| Italic | For applying italic style. |
| Underline | For applying underline style. |

Strike out	For applying strike out style.
Super	For applying super script style.
Sub	For applying super script style.
Empty	Clear styles.

Special characters

Use the special character option (TM) for inserting special characters.

Lists

Select text and apply ordered or unordered (bullets) lists by using the list icons.

Unordered list

- * Element a
- * Element b

Ordered list

- * Element a
- * Element b

Tabs

Select text and insert tabs by using the tab icons.

Links

Use the link icons to create links in your content. Select the text part that you want to link and click on the internal or external link icons.

Internal links are links to your own content (in the same application). After clicking on the internal link item, a browser is presented, select the item that the link should go to.

External links are links that point to other websites (external websites). After clicking on the external link item, a window is presented in where you can enter the link url.

External links are tested every night by the application server. A list of found broken links is given daily in the application statistics 'External link test report'.

The image shows a small dialog box titled "External link". Inside the dialog, there is a label "link:" followed by a text input field. The dialog has a standard window border with a close button in the top right corner.

Xhtml Content filter

When copy pasting content from other web sites or text editors like Microsoft Word the content many times has wrong and unsupported html code. This function filters non xhtml standard code to ensure technically correct content.

Spell check

Deprecated, only works in internet explorer with third party components.

Text edit functions

Copy	Copy text
Paste	Paste text
Cut	Cut text
Undo	Undo text editing
Redo	Redo text editing
