

## Folder service

The folder service is an empty container for storing other items. The folder service is mostly used to structure content, pages and other services in a web application.

The screenshot shows a web form titled "Folder service" with a save icon in the top right corner. The form contains four input fields:

- title:** A single-line text input field.
- additional link title:** A single-line text input field.
- description:** A large multi-line text area.
- meta keywords:** A single-line text input field containing the text "Keyword a, Keyword b, Keyword c, Keyword d, Keyw" and a small edit icon on the right.

### *Title*

The title or name of the folder. The title is presented to search engines and can be presented in the page (Item presentation properties)

### *Additional link name*

This is the title that is used when the folder is presented as a link. When no additional link name is given then the folder title is used.

### *Description*

The description of the folder.

### *Meta Keywords*

The meta keywords have two functions,

- \* Meta keywords are presented in the page meta data for search engines.
- \* Meta keywords are searchable by the application search engine. For example, if you want your content to be searchable by specific keywords that are not used in your content you can add these keywords in this field.

Meta keywords
