

## Item view service

An item view service is used to put a view on an item or a groups of items. The view service presents the item or items using a design and interaction design definition stored in a template. Because of the open nature of this service/function this service is used for many presentation purposes depending on the used templates. In general the item view service is used for the following functions,

- \* To show an item or group of items on another location in a site or application.
- \* For the creation of menus, link lists and content lists.

The screenshot shows a configuration window titled "Item view service". It contains the following fields:

- name:** A text input field containing "Item view service".
- description:** A large empty text area.
- item:** A dropdown menu showing "Xsdot - Main content pages -".
