

Service property pages

Every service, component or item in the Xsdot application server derives a standard set of properties that are used to control the item's presentation, order, design, positioning, security and more. The properties of an item can be accessed by selecting the right mouse button on a selected item. Click on the property options in the menu to access the property pages. Some property options are directly available in the property menus or other controls. The next chapters give information about the available property pages.
